Omni*Chat: Creating a FORTH Shell within Java based BitTorrent Client BiglyBT Decentralized Chat (BBDC) --- Liang Ng

This presentation focuses on how FORTH derived Phoscript can be used to modify BiglyBT Decentralized Chat, in order to create a stack machine engine within a Java host. (10 minutes)

This presentation focuses on how FORTH derived Phoscript can be used to modify BiglyBT Decentralized Chat, in order to create a stack machine engine within a Java host. (10 minutes)

BiglyBT is a BitTorrent client written Java and BitTorrent has been known to be a file sharing platform for “unregulated” contents.

The second part of this presentation focuses on Omnicontract, a smart contract based on Omnihash, to address some regulation issues concerning digital assets ownerships, as well as law enforcement. (10 minutes)

Stripes but no Stars.

Finally we shall briefly talk about the roadmap for this platform, namely Omni*Chat (pronounced “Omni Star Chat”), Omni*Web (“Omni Star Web”) etc. We chose the name Omni meaning “anything” as it is the opposite of UNIX (meaning “One”), and * also means “anything” in UNIX “clone” environments. (10 minutes) BitTorrent laid the foundation for a “decentralised” Internet, but unfortunately for over 20 years, there did not seem to be attempts to create FORTH-like shell on BitTorrent, except for BitCoin and other Blockchains.

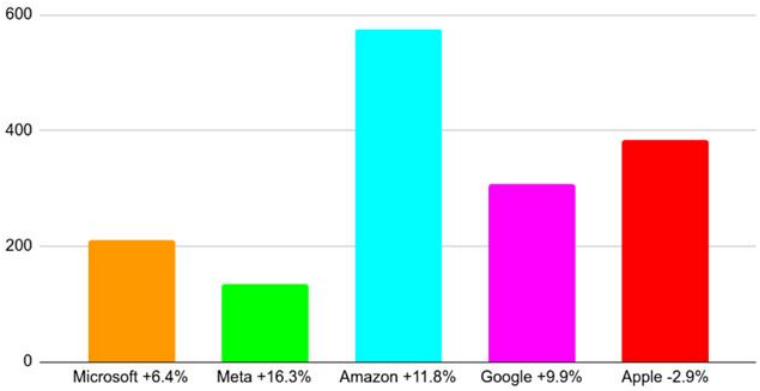

We hope Omni*Web will pick up from where BitTorrent left us, i.e. file-sharing and a very obscure chat feature, which is the highlight of this talk, and continue to create “Decentralised Cloud & Metaverse”, using BitTorrent’s greatest feature – bypassing DNS – saving GLOBAL monthly DNS charges in USD 100 millions.

Finally we pay tribute to the late Vernor Vinge, who first popularised the concept of “technological singularity”, and make a daring but calculated estimate on “Decentralised Cloud AI” based on Omni*Web and hash indexed decentralised database by end of 2025.

The photographs and charts used in this presentation were used in a YouTube video intended for audience outside USA. As such, they may raise questions for audience with USA, and much apologies are reserved for offending sensitivities. (Monty Python style humour is implied and encouraged.)

The term MMAGA on the bottom left refers to Microsoft, Meta, Amazon, Google & Apple and shall not be confused with any other similarly spelled term.

The photograph on the top left serves to illustrate the plight of free software programmers who fruits of labour are stolen by corporations likened to railway tycoons.

In this video, we begin by pointing out the “MMAGA inequality”, where top 5 tech companies, namely Microsoft, Meta, Amazon, Google & Apple, earning over USD 1.6 trillion in 2023, without fairly rewarding individual users & free software programmers.

We then propose Omni* platform, combining BitTorrent, Phoscript & Omnihash in an unprecedented manner, allowing anyone to learn & program a server easily with Phoscript, while monetising the digital assets with Omnihash, on any computer or device connected to Internet, bypassing DNS with BitTorrent.

With this, we aim to establish a truly Decentralised Cloud & Metaverse, owned and operated by individual users & free software programmers.

In this video, we begin by pointing out the “MMAGA inequality”, where top 5 tech companies, namely Microsoft, Meta, Amazon, Google & Apple, earning over USD 1.6 trillion in 2023, without fairly rewarding individual users & free software programmers.

We then propose Omni platform, combining BitTorrent, Phoscript & Omnihash in an unprecedented manner, allowing anyone to learn & program a server easily with Phoscript, while monetising the digital assets with Omnihash, on any computer or device connected to Internet, bypassing DNS with BitTorrent.*

With this, we aim to establish a truly Decentralised Cloud & Metaverse, owned and operated by individual & free software programmers.

MMAGA Revenues 2023 (USD billions)

Total: USD 1.611 Trillion (+7.26%)

A literal trillion dollar question: Do you know that the combined revenues of the top 5 technology companies in 2023 already exceeded USD 1.6 trillion and are growing strongly above 5% annually?

Stripes but no Stars,
Asheville, N. C.

Using the definition by the contrary, [centralised cloud and metaverse](#) is what we have now, where less than 1% or 0.1% of the revenues of the technology companies are fairly shared with individual users and free software programmers.

FORTH word vs. Hash

While making a video tutorial to explain the concept of hashcode to general viewers on YouTube, I used Hilbert's Infinite Hotel as an example.

As hash numbers are simply very large integers, they fit in well with Hilbert's Hotel quite naturally. I.e. In Decentralised Metaverse, you can a room in Hilbert Hotel whose room number is a hash number.

FORTH Word vs. Hash

Automorphism: entry to abstract mathematics

Omni*Chat security: Every WORD Definition has a unique hash (code).

Automorphism: Each word is in turn defined by concatenation of a sequence of words.

Example: same as Omnihash, hash of list of hashes is another hash.

(Big topic on its own. Beyond the scope here.)

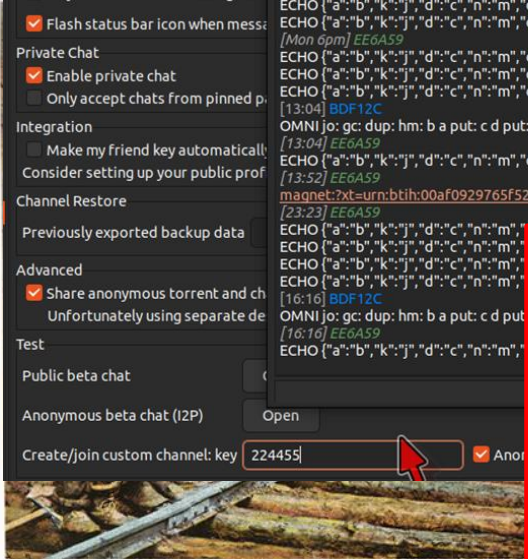

Variable based programming languages (VBPL) use random variable names in body – disrupt hash calculations. Corrected using Phoscript (converts VBPL to RPN / FORTH / Variableless Programming Languages VLPL) (bridging VBPL & VLPL: most significant contribution?)

Hash relates the technical aspect to the legal aspect of texts.

[FORTH in Firefox: very likely JavaScript engine is a stack machine, modify it to run FORTH.](#)
[OR add other Intel x86 FORTH\(s\) into Firefox.](#)

Bitcoin & other Blockchains are known to use FORTH like script for programming. (Same principle as Omni*Chat?)

Is DNS the biggest obstacle to Decentralised Cloud & Metaverse? Perhaps. If each server address costs USD10 per month, imagine the total cost saving GLOBALLY.

BitTorrent & Blockchains are 2 “Hyper DNS” (H-DNS) systems that are known to work well, but not as ubiquitous as web servers. Omni*Chat shall change that. (H-DNS could mean “hidden”, “hashed”, etc.) Their source code can be examined to verify if they work on the same principles.

Not trying to be ambitious, but Phoscript & Omnihash seem to be playing several crucial roles for AI development in the future:

1. Phoscript provides a low barrier of entry for non-FORTH programmers to learn FORTH, starting from the most popular programming languages such as PPJJCC (PHP, Python, JavaScript, Java, C++, C#).
2. Phoscript MAY help simplify future AI chip design with Homotronic Computing.
3. Omnihash makes Decentralised Cloud AI (DCAI) possible.

Automorphism is a permutation of a set which respects some structure on the set. What structure? It varies. Automorphism is a general term and does not apply simply to groups, or rings.

22

In the context of $(\mathbb{Z}, +)$ as an additive group, we say that $f: \mathbb{Z} \rightarrow \mathbb{Z}$ is an automorphism if:

- f is a bijection,
- $f(m) + f(n) = f(m + n)$,
- $f(0) = 0$.

Now suppose that f is an automorphism like that. Well, $f(0) = 0$. If $f(1) = 1$ then f has to be the identity, because for $n > 0$ we have

$$f(n) = f(\underbrace{1 + \dots + 1}_{n \text{ times}}) = \underbrace{f(1) + \dots + (1)}_{n \text{ times}} = \underbrace{1 + \dots + 1}_{n \text{ times}} = n$$

and if $n < 0$ then

$$0 = n + (-n) = f(n) + f(-n) = f(n) + (-n)$$

and therefore $f(n) = n$ as well.

Similarly if $f(1) = -1$ then $f(n) = -n$ for all n . So these are two
